

ARI 300 UNDERFRAME DESIGNATION CODES

New underframe designation codes are being introduced to designate variations of the ARI 300 underframe. The underframe codes are being introduced to more closely reflect design differences from the original ARI 300 underframe. These codes will allow the industry to track underframe performance based on the features of the underframes.

The ARI and the AAR have designated the underframes as:

- ARI300 Underframes built to the 1996 REPOS data
- ARI301 ARI 300 Underframes built to the 1996 REPOS that were modified by the owner with the sill termination reinforcement pad per the ARI Inboard Sill Maintenance Advisory.
- ARI310 Underframes built to the 2011 REPOS data and were built new with sill termination reinforcement pads.
- ARI330 Underframes built to the 2011 REPOS data for high utilization service, built new with sill termination reinforcement pads.
